Please provide the duration of your employment or service and details about the nature of the work or the position.

During summers before graduation worked for Orangeburg Dept of Public utilities updating distribution system maps.

Prior to SRNS, engineering details are probably not relevant. I can provide if required.

At Savannah River Nuclear Solutions(SRNS), in H-Canyon and H-Outside facilities. the radioactive waste metal and liquid from nuclear energy production are converted into more stable compounds.

As instrument engineer in H area for four years, I led and facilitated the replacement

and calibration of defective process equipment such as instruments, heat tracing and wiring. As site utilities engineer for

the next five 1/2 years identified errors in utilities 13.8kv metering, installed 480v distribution panels and led troubleshooting

of site infrastructure equipment including standby generator sets. Checked work performed by contract engineers.

At URS, completed a conceptual design of a Dept Of Energy waste treatment facility.

At VC Summer Units 2 and 3 the license granted by NRC required the facility to be constructed per documented specifications and drawings.

For four years I dispositioned construction errors in the electrical system, mostly grounding, to conform it to specifications.

On the reactor containment building for example, the grounding conductors imbedded in the concrete wall had no provision

for connecting to the steel covering. The electrical drawings were incomplete and I designed the connections while consulting

with mechanical engineering and construction.

As responsible engineer for 6.9kv switchgear, led weekly conferences with Eaton, the manufacturer, to correct non conforming

design drawings and manufacturing. Led testing of switchgear at the Eaton factory and corrected electrical performance defects.

As responsible engineer for iso-phase bus (from 30kv generator to 115kv and 6.9kv transformers)

I led weekly conferences with AZZ, the manufacturer, to correct non-conforming design, testing reports and

manufacturing. For example, the buss was to be short circuit tested at about a million amps. The specification called for the test current to

also flow through the aluminum shell but I found that AZZ used an obsolete test that bypassed the shell. This was a considerable

expense for them. I also mentored a junior engineer who was responsible for 480v switchgear.
